

## ME 1020 Engineering Programming with MATLAB

Problem 7.11:

**11.\*** A shipping pallet holds 10 boxes. Each box holds 300 parts of different types. The part weight is normally distributed with a mean of 1 lb and a standard deviation of 0.2 lb.

- Compute the mean and standard deviation of the pallet weight.
- Compute the probability that the pallet weight will exceed 3015 lb.

Problem setup:

$$\mu_{\text{pallet}} = \mu_{\text{part 1}} + \mu_{\text{part 2}} + \dots = 3000(1.0 \text{ lb}) = 3000 \text{ lb}$$

$$\sigma_{\text{part}} = 0.2 \text{ lb}, \quad \sigma^2 = 0.04 \text{ lb}^2$$

$$\sigma_{\text{pallet}}^2 = \sigma_{\text{part 1}}^2 + \sigma_{\text{part 1}}^2 + \dots = 3000(0.04 \text{ lb}) = 120 \text{ lb}^2$$

$$P(x \leq b) = \frac{1}{2} \left[ 1 + \operatorname{erf} \left( \frac{b - \mu}{\sigma\sqrt{2}} \right) \right]$$

$$b = 3015 \text{ lb}, \quad \sigma_{\text{pallet}} = \sqrt{120} \text{ lb}, \quad \mu_{\text{pallet}} = 3000 \text{ lb}$$

$$P(x \leq 3015) = \frac{1}{2} \left[ 1 + \operatorname{erf} \left( \frac{3015 - 3000}{\sqrt{120}\sqrt{2}} \right) \right]$$

$$P(x \geq 3015) = 1 - P(x \leq 3015)$$

```
